Supplementary material

Dilution-dependent antibacterial activity of honey: a systematic review and quantitative synthesis of physicochemical and microbiological evidence

For submission to International Journal of Food Microbiology.

S1. Search strategy and yields

All searches were executed programmatically on the dates shown; raw API responses are retained in the repository archive. Europe PMC queries were capped at 500 retrieved records per query and Crossref at 100, ranked by relevance.

Table S1. Full search queries, dates and yields.

S2. Eligibility decision rules

A deterministic rule-based classifier assigned each screened record to include / exclude / review_flag using title-and-abstract patterns. The complete rules are implemented in scripts/04_eligibility.py in the released code. Decision counts:

Table S2. Eligibility decisions by rule outcome.

Decision rule outcome	n records
meets criteria	381
no quantitative antibacterial outcome	175
formulation with inseparable matrix	83
combination therapy - verify honey-alone arm	23
non-bacterial outcome only	21
non-honey bee product is main article	19
clinical/in-vivo without microbiological assay	13
post-hoc audit: not honey-specific primary data	8
viral/phage outcome only	3

S3. Extraction and provenance

Each extracted row carries study_id, source table identifier, row and column position, raw cell text, normalized outcome, unit, unit basis and an auto/manual flag. Manually curated mechanistic rows (n = 0) take precedence over automatically extracted rows for the same cell. Outcome categories in the harmonized dataset:

Table S3. Harmonized outcome categories.

Outcome	n rows
MIC	2572
zone	1433
MBC	710
H2O2	94
series	84
phenol_equiv	69
TPC	49
GOX	33
aw	19
n_outperform_manuka	19
phenol	17
pct_viable	15
color	12
MBEC	12
MIC50	10

pH	10
pct_inhib_biofilm	8
MGO	4
PLA	4

Reported concentration bases were preserved and analyzed separately:

Table S4. Concentration unit bases (not pooled).

Unit basis	n rows
% (basis unspecified)	1461
mm	1386
other	850
%v/v	643
%w/v	489
mass	246
%w/w	99

S4. Extraction-selection characterization

Of 404 eligible studies, 247 had a resolvable PubMed Central identifier, 226 had an open-access JATS XML full text, and 102 yielded machine-extractable outcome data. Extracted studies were more recent (median year 2022 vs. 2020; Mann-Whitney p = 2.04e-04). The most frequent journals among non-extracted eligible studies:

Table S5. Journals most represented among non-extracted eligible studies.

Journal (non-extracted eligible)	n studies
Antibiotics (Basel, Switzerland)	14
Foods (Basel, Switzerland)	11
Food chemistry	10
Journal of applied microbiology	9
Journal of medicinal food	8

Reasons for non-extraction fall into three classes: (i) no resolvable PMC identifier (typically journals not deposited in PMC or closed-access publisher versions); (ii) PMC identifier present but no open-access full text; (iii) full text retrieved but containing no outcome table matching the documented parsing layouts (data reported only in figures, in prose, or in non-tabular supplements). Counts are reconciled in Fig. 1 of the main text.

S5. Reporting-quality / risk-of-bias framework

Five domains, each scored 0-2: D1 assay standardization; D2 comparator quality; D3 dispersion reporting; D5 mechanistic perturbation; D6 reporting completeness. Concentration-series availability is an availability flag, not a quality score. Ratings: low (total >= 8), some (5-7), high (<= 4).

Table S6. Per-study reporting-quality scores.

study_id	D1_assay_std	D2_comparator	D3_dispersion	conc_series_avail	D5_mechanism	D6_reporting	total	rating

S6. Extended analyses and sensitivity results

Spearman associations between honey-level physicochemical parameters and antibacterial outcomes (joined on study and normalized sample label):

Table S7. Chemistry-outcome Spearman correlations.

Parameter	Outcome	n	n studies	rho	p
H2O2	MIC	29	2	0.460	0.0122
MGO	MIC	116	1	-0.517	2.78e-09
aw	MIC	20	1	-0.058	0.807
pH	MIC	359	7	0.071	0.179
pH	zone	53	2	-0.518	6.99e-05
TPC	MIC	172	5	-0.152	0.0459
TPC	zone	54	1	0.259	0.0586
moisture	MIC	112	3	0.165	0.0812
moisture	zone	45	1	-0.068	0.658

Leave-one-study-out cross-validation of outcome models (log10(MIC)):

Table S8. Leave-one-study-out cross-validation (n = 155, 3 studies). Negative R2 indicates worse-than-null out-of-study performance.

Model	Predictors	CV R2	CV RMSE
Null	-	-0.119	0.231
Chemistry	pH, TPC	-32.317	1.261
Label only	manuka/medical-grade flag	-0.119	0.231
Combined	chemistry + label	-32.317	1.261

Sensitivity analyses:

Table S9. Sensitivity analyses on MIC subsets.

Subset	n rows	n studies	Median MIC (%)
Low reporting-concern studies	512	8	16.835
Manuka-labelled excluded	2172	-	18.0
Manuka-labelled only	146	-	15.0
% w/v basis only	369	-	15.0
% v/v basis only	481	-	12.5
Studies measuring water activity	126	2	25.0
Studies measuring H2O2	226	7	16.0
Peer-reviewed only	2318	-	17.5

Leave-one-study-out resampling of the manuka-vs-other MIC contrast returned non-significant results ($p > 0.05$) in 0% of iterations.

Natural-vs-artificial pairs by study (direction-normalized potency ratio; >1 indicates greater natural-honey activity):

Table S10. Natural-vs-artificial potency ratios by study.

Study	Outcome	n pairs	Median potency ratio
PMC11111008	MIC	3	1.19
PMC13460517	MIC	4	1.95
PMC3406342	MIC	1	1.30
PMC6659206	MIC	3	2.69
PMC7076972	zone	4	n/a
PMC8234392	MBC	2	1.06
PMC8234392	MIC	2	1.06
PMC8304482	zone	6	1.46

S7. Studies included in the quantitative synthesis

Full author-year references for the 102 studies from which quantitative data were extracted. PMCID identifiers are retained in the released dataset (data/extraction.csv) for row-level provenance.

Table S11. References of studies included in the quantitative synthesis (alphabetical).
